POLICE OFFICERS AND OTHER FIRST RESPONDERS MAY ENCOUNTER OR BE ASKED TO PROVIDE SERVICES TO A PERSON WITH AUTISM SPECTRUM DISORDER. RECOGNIZING THE SIGNS OF AUTISM AND KNOWING EFFECTIVE WAYS TO Approach A PERSON ON THE AUTISM SPECTRUM CAN MINIMIZE SITUATIONS OF RISK OR VICTIMIZATION OF THE INDIVIDUAL, AS WELL AS THE RISK TO THOSE INTERVENING.

Individuals with autism spectrum disorder (ASD) have difficulty picking up social cues (social referencing) and understanding other individual’s thoughts and intentions, making them vulnerable to a range of crimes, from fraud and theft to more violent crimes. Individuals with ASD are also generally taught compliance from a very young age, making them easy targets for abuse and victimization. When assisting a crime victim who is on the autism spectrum, first responders should take specific actions to communicate with and support the individual.
WHAT IS AUTISM?
Autism is a spectrum disorder that affects every individual to a differing degree. Autism is a complex developmental disability. It is a neurological condition with a variety of symptoms that affect individuals in different ways. It knows no racial, ethnic or social boundaries. People with autism may have difficulties in communication and social understanding. They may also have unusual reactions to sensory input, and may demonstrate what appear to be inappropriate behaviors. Autism spectrum disorders (ASD) are now known to be more common than previously thought, affecting as many as 1.5 million individuals nationwide.

CONSIDERATIONS FOR POLICE AND OTHER FIRST RESPONDERS
There will be many situations in which a person on the autism spectrum may encounter police. A survey of individuals with ASD and their families indicated that 35% of individuals with autism had been the victim of a crime and that 23% had had interactions with first responders due to wandering or eloping (Autism Society, 2006). When responding to situations involving individuals with ASD, officers should take into consideration that individuals with disabilities are often taught compliance - values and beliefs that affect behavior and social etiquette that may make them more vulnerable to victimization. Individuals on the autism spectrum may:

- Not question “rules” or those in charge
- Not be assertive
- Agree with adults or authority figures out of necessity
- Always honor other people’s opinions or their personal choices may not be honored by others
- Be taught to be obedient and dependent

Due to the nature of autism and the social environments in which individuals with ASD may live, the risk for victimization and abuse is heightened by:

- The individual’s reduced privacy
- Lack of teaching regarding healthy sexuality and decision-making
- Reduced expectations by caregivers and others
- Rewards provided for obedience and passivity
- Limited friendships and increased social isolation
- Negative attitudes toward those with disabilities

First responders should also be aware that autism is a spectrum disorder that affects every individual to a differing degree. Individuals may be highly verbal or nonverbal, have above-average intelligence or cognitive limitations (intellectual disability), and may respond differently to sensory stimuli. During instances of heightened anxiety or when they do not know what is expected of them, individuals with ASD may also lose some of their abilities more readily. Providing reassurance will assist in alleviating the individual’s anxiety and discomfort.

Success in providing services is more likely when a first responder assisting a person with ASD has information regarding the individual’s regular behavior and communication patterns. First responders should have basic knowledge of how to meet the individual’s needs and, if additional assistance is necessary, collaborate with a professional familiar with autism. For officers conducting initial investigative interviews, it will be essential to be comfortable with the individual. If there is doubt as to the abilities of an interviewer, seeking out a Forensic Interviewer with knowledge of autism will aid dramatically in the development of a case for prosecution. Individuals with ASD often seek “sameness” or consistency; therefore, if initial contacts with first responders are negative, the investigation could be prolonged.

Knowledge of the individual’s method of communication is vital, thus the interviewer should have resources available for working with an interpreter or facilitator. It is estimated that 30% to 50% of individuals with autism are nonverbal and even those who are verbal may process and communicate information in different ways. Individuals with ASD may have immediate or delayed echolalia (the repetition or echoing of verbal utterances made by another person). Immediate echolalia may be used with no intent or purpose or may have a very specific purpose for the individual. Delayed echolalia appears to tap into long-term auditory memory, can involve the recitation of entire scripts, and can also have both noncommunicative and communicative functions. Knowing the individual well is a key to understanding his or her specific use of echolalia and other communication traits. Ensuring the interview setting is private and lacks distractions is also essential. All parties involved should be aware that interviews of crime victims on the autism spectrum will take more time. Within the courtroom setting there will be time needed to prepare an individual to participate in the process of a trial. Assisting the individual with ASD to become familiar with the setting, the concepts involved, and expectations will allow them to participate more effectively. It is also very important that if a person with ASD is a victim of a crime, they be reassured that they will be safe in the presence of the perpetrator. At the end of prosecution, no matter the outcome, an explanation will be required to allow for closure.

APPROPRIATE RESPONSE/DELIVERY OF SERVICE
A lack of personal familiarity with individuals who have a disability may cause first responders to feel professionally awkward and uncertain when providing emergency care and assistance. Common reactions
to individuals with disabilities include fear, embarrassment, or pity and, unfortunately, too often disbelief, disregard, or discounting of information supplied by the individual.

Awareness and education of first responders about disabilities increases their ability to provide appropriate response. Recognizing behaviors associated with autism will allow you to best respond to the situation. A person on the autism spectrum may:

1. Not respond to a uniform, badge, or other emergency response symbols. Autism may limit a person’s ability to recognize and differentiate uniforms and other common symbols. Pointing out these items to allow the person to focus is helpful.

2. Avoid eye contact. People with ASD often have difficulty making eye contact. Do not insist on eye contact or misinterpret lack of eye contact as disrespect or guilt.

3. Make repetitive motions or sounds. Repeated movements or sounds may be a signal of distress but may also be the person’s means of securing comfort. Unless the person is causing injury or damaging property, do not stop these behaviors.

4. Become upset when touched. Avoid touching if possible. If you have to have physical contact with the individual, explain in simple terms what you are going to do and why. Try saying, “I want to help you, but I (explain what you intend to do).”

5. Not provide I.D. when asked. Be patient and speak slowly and calmly. Keep questions simple and allow time for answers. Repeat or rephrase. The person may not be able to speak. Check for ID jewelry, an ID card, or ID sewn into the individual’s clothing.

6. Lack awareness of danger. Gently persuade or remove the person from the dangerous situation. Offer an alternative to the dangerous action. Be aware that if the person is anxious there is a risk they could bolt without warning.

7. Continue to do something after being told to stop. Demonstrative, non-threatening gestures may communicate more effectively than a verbal command. Demonstrate what you want the person to do. Repeat the behaviors and instructions. Use a communication board if possible and allow time for processing of information before responses are given.

8. Appear to be under the influence of alcohol or drugs. The actions of people with ASD can appear to be odd or inappropriate. When asked about drug use, the person may admit to having taken drugs if they take prescribed medications. Avoid making assumptions about alcohol or drug use.

9. Become self-injurious. Under stress an individual may become self-injurious. Use the least invasive technique possible to ensure the individual’s safety.

10. Become aggressive. Restraints should only be used if the individual’s or other’s safety is at risk. Individuals with ASD may have a poorly developed upper trunk area. Positional asphyxia could occur so it is critical to ensure that a prone position is not used and the person is moved to a secure and quiet place away from distractions. Deescalation techniques to calm or distract the individual are safer and more effective.
